

Using the Weather Dashboard Starter Project

For the next part of the course, we will use the Weather Dashboard starter project.

Step 1: Open the Weather Dashboard project

Open this folder in Visual Studio Code:

 Starter Projects - Codex Workflows

 Weather Dashboard

 react_project ← open **this** folder

Make sure you open the react_project folder itself.

Step 2: Run the app locally

Open the VS Code terminal while you are inside the Weather Dashboard/react_project folder.

Then run:

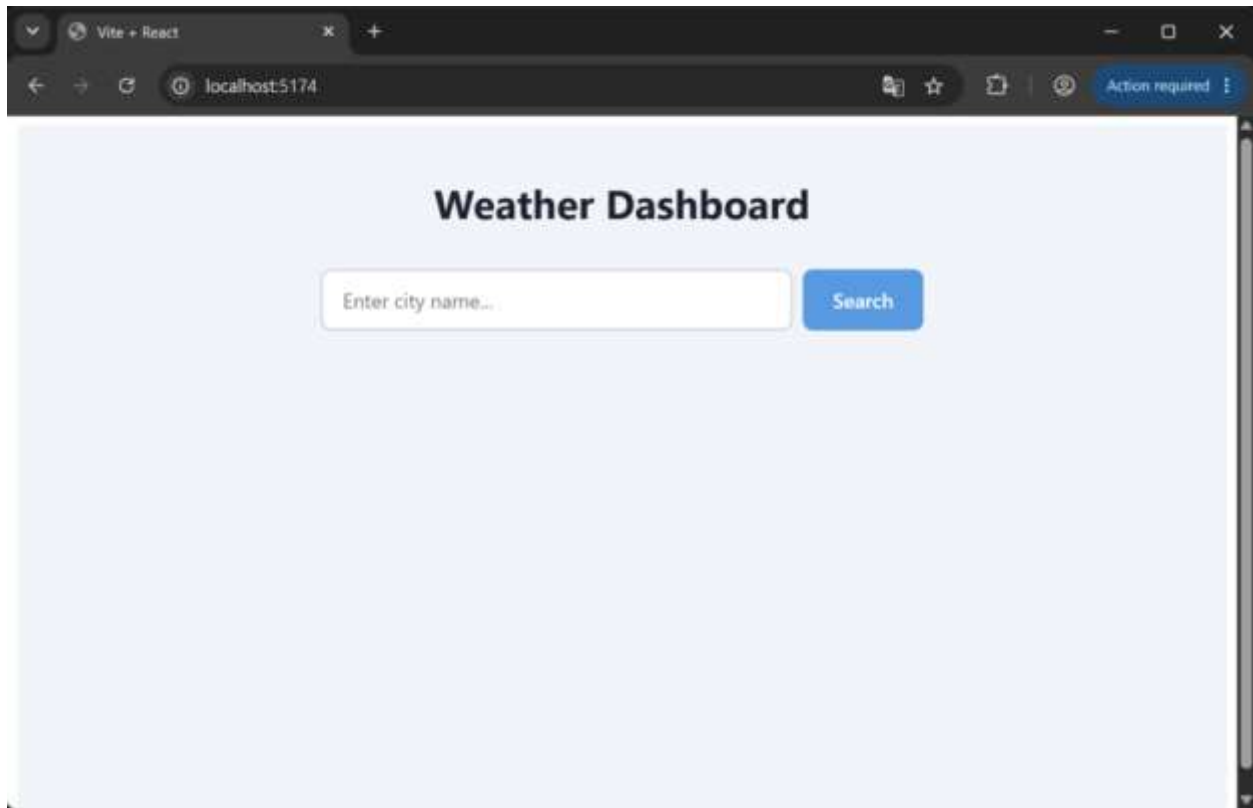

```
npm install
```

```
npm run dev
```

Open the local URL shown in the terminal, usually:

```
http://localhost:5173
```

You should see the Weather Dashboard app in your browser.

Step 3: Start Codex in the same folder

In the project terminal, start Codex:

```
codex
```

Codex should start inside the same `react_project` folder so it can see the project files.

Step 4: Run the tests when needed

When the course asks you to verify work, run:

```
npm run test
```

If something does not work, first check that your terminal is inside the `Weather Dashboard/react_project` folder.
